Prompt 2. Cafe Operations Memo

cafe_sales.csv. 6,159 transactions, June 2025 to May 2026, all rows used.

1. Best and worst sellers: revenue and units do not agree

	By revenue	By units
Best	Beans 1kg, EUR 8,512	Toast, 605 units
Worst	Filter, EUR 846	Beans 1kg, 266 units

Beans 1kg is number one in revenue but last in units sold. It is an expensive, low volume item, while Toast sells the most units but ranks well below it in revenue.

2. Weekend lift

Average daily revenue is EUR 114.0 on weekends versus EUR 72.9 on weekdays, a **56.4% lift**.

3. Morning versus rest of day

Morning alone accounts for **42.3% of total revenue**, more than any other single daypart (midday 22.1%, afternoon 20.0%, evening 15.5%).

4. Summer surge: not present

Average monthly revenue in June to August 2025 was EUR 2,524, versus EUR 2,594 for the rest of the year, about **2.7% lower**, not a surge. Caveat: the file only contains one summer window, so this cannot be confirmed as a seasonal pattern rather than one year of noise.

5. Payment mix

Card: 61.2% of revenue (3,800 transactions). Cash: 22.5% (1,438 transactions). App: 16.3% (921 transactions). Card is the dominant method by a wide margin.

Headline number, reproduced independently

Total revenue across the full period: **EUR 30,921.90**. Checked two ways:

First, recalculated unit_price times quantity for all 6,159 rows. It matches total_eur exactly, with zero mismatches.

Second, tested what a silent 6,000 row sample would have produced instead of the full file. That sample understates revenue by EUR 908.20, about **2.9% too low**, because it drops the last 9 days of May 2026. All 6,159 rows were used in the numbers above.

Two recommendations

1. Protect and grow Beans 1kg sales at the register through bundling or upsell. It is the single largest revenue line despite the lowest unit volume, so small volume gains here move revenue more than any other product.

2. Prioritize morning staffing and stock levels before adding afternoon or evening promotions. Mornings alone already outproduce the rest of the day combined in revenue share.

Open question, not answerable from this file: card's 61% revenue share carries a processing fee cost that is not in the data. Net margin by payment method cannot be computed without fee rates.
